MitosScope — Getting started

Nov 8, 2026 · @Luiz

MitosScope is an overlay for the Mitos.is desktop client that shows your match, account, quests and equipment on top of the game, for every account you have open.

Install and first launch

You need Windows 10 or 11 and the Mitos.is desktop client, logged in. MitosScope runs alongside the game; it never changes anything in it.

1. Extract the MitosScope release to any folder and run `MitosScope.exe`. It has no main window: it lives in the system tray, next to the clock.
2. Open Mitos.is and log in. If the game is already running, MitosScope finds it within a few seconds.
3. In the game, a popup asks whether to allow **MitosScope**. Click **Allow**. If you are in a match, the popup waits until you return to the menu.
4. On the first launch the panels open in **edit mode**: drag them where you want them and resize them from the edges. Close any panel you don't need with its ×.
5. Press **Ctrl+Shift+E** to lock the layout. The panels become click-through, so your clicks go to the game, and the layout is saved.

The game remembers your choice per account, so the popup only shows once for each account. If you click **Deny** by mistake, restart the game to get the popup again.

The panels

Each panel is its own window, so you can place it anywhere and turn it on or off independently.

Panel	What it shows	Refresh
MitosScope	Connected game clients and connection status	Live
Match	Alive, room, mode, mass, peak mass, cells, leaderboard position, region	Every 1 s
Last Match	Duration, peak mass and best position of your previous match	After each match
Account	Level, coins, rank, MMR, guild, server	Every 60 s

Panel	What it shows	Refresh
Quests	Open quests with progress (current / target) and reward	Every 60 s
Equipment	Your equipped items	Every 60 s
All Time Stats	Time played, max score, kills, splits, ranked wins / losses	Every 60 s

Account data comes from the game servers and is refreshed about once a minute, so it can lag behind the game by up to 60 s. Exp quests show the reward type ("EXP") without the amount, because the game currently reports the wrong number.

Everyday use

The overlay shows only while a game window is focused. Switch to another app and it hides; go back to the game and it returns.

Ctrl+Shift+E toggles edit mode from anywhere, even while the game has focus. Use it whenever you want to move or resize panels, then press it again to lock.

Right-click the tray icon for the menu (a left-click toggles edit mode):

- **Edit mode** — same as Ctrl+Shift+E.
- **Show overlay** — hides or shows all panels at once.
- **Panels** — turn each panel on or off.
- **Open settings folder** — opens `%APPDATA%\MitosScope`, where the layout is saved in `settings.json`.
- **Exit** — closes MitosScope.

Multiple accounts: MitosScope connects to every open game client (up to 20). Each account asks for permission once. The panels follow the game window you focus, so switching to another client switches the data shown.

Troubleshooting

You see	What to do
"Looking for the game…"	Open Mitos.is and log in. MitosScope only connects to logged-in clients.

You see	What to do
"Instance without API (PID …)"	That client is running but its addon API is off. Log in; if it is already logged in, restart that client. This happens after a match ends in some modes, and after switching accounts without restarting.
No popup in the game	Go back to the main menu; the popup never shows during a match. If you clicked Deny before, restart the game.
Panels are missing	Make sure a game window is focused, then check **Show overlay** and **Panels** in the tray menu.
A panel is off-screen	Turn on edit mode; panels saved on a monitor that is no longer connected return to their default position.
Can't click the game through a panel	Edit mode is on. Press Ctrl+Shift+E to lock.
